Kepler Update

- Launch was March 6, 2009.
- Dust cover ejection was April 8, 2009.
- Commissioning ended May 12, 2009.
- During last 10 days of commissioning, ~53k stars brighter than Kepler_mag 13.5 were observed as part of engineering checkout.
- During the 35 days from the end of commissioning to the first quarterly roll, ~145k stars were observed. (Quarter 1)
- These data were downlinked on June 16, 2009; transfer to the SOC was complete on June 23, 2009.

General Background

- The Key Project for Kepler is discovery and characterization of Earth-like planets around solar-type stars. The product is light curves.
- The data are dumped from Kepler on a monthly basis. The data flow is from Kepler to the Deep Space Network to the Mission Operations Center (LASP), to the Data Management Center (DMC at STScI), to the Science Operations Center (Ames), then back to the DMC for archiving. *This last transfer occurs quarterly.*
- Access to *data in* the Kepler archive is through MAST.

Kepler First Light Image

Documentation - Manuals

- **Kepler Archive Manual – Project deliverable prepared by the DMC. Draft version with release planned for mid-July 2009.**
- **Kepler Instrument Handbook – Kepler Project has contracted with Jeff van Cleve to write this document. Draft version with release planned for mid-July 2009.**
- **Kepler Data Handbook – Kepler Project has contracted with Jeff van Cleve to write this document. Release planned in late 2009.**

MAST Interface Pages

MAST anticipates 2 general types of users

- > Proposers for Kepler time**
- > Archive users who wish to retrieve Kepler data**

The needs of the groups are different. Proposers are searching for targets to observe and archive users are searching for existing data.

MAST developed the Target Search page for proposers and the Data Search and Retrieval page for archive users.

Target Search Page

Search objects the Kepler Input Catalog (KIC) and the characteristics table (CT) have in common – These objects fall on the detectors.

Search fields include astrophysical quantities

Modified and/or additional fields – seasons on CCD, minimum distance from edge, contamination

Reserved target flag (planned) – These objects are Key Project targets and may not be proposed.

Currently password protected (i.e., not public)

Kepler Target Search Help

Use the Kepler Target Search form to find targets that are listed in the Kepler Input Catalog (KIC) AND believed to be "on or near the detector". The interface will allow searches on roughly 6.5 million entries (~ half of the total in the KIC). Of these, about 4.41 million are "on" the detector for at least one season and 4.38 million are "always on" the detector. The remaining 2 million are considered "near" the detector.

Note about the KIC astrometry (RA, Dec, proper motion, parallax). The source of the astrometric quantities depends on which catalog (or catalogs) contain data for a given star. To ensure the highest accuracy and to minimize systematic errors, the hierarchy for the choice of astrometric values is as follows:

- SCP (50 milliarcseconds but closer to Kepler epoch)
- Hipparcos (10 milliarcseconds)
- Tycho-2 for V brighter than 8.0 (20 milliarcseconds)
- UCAC2 (40 milliarcseconds)
- 2MASS (70 milliarcseconds)
- USNO-B1.0 (200 milliarcseconds)

The values listed in the KIC come from the first entry in this list that contains each star. The source catalog should be consulted for a detailed discussion of astrometric accuracy. The quantities listed here are global averages.

Also note that there are four sets of the module, output, channel, row, and column parameters, one set for each season. The season information is included in the name of the field (e.g. MODULE_SEASON_0, OUTPUT_SEASON_0, etc). Seasons run from 0 to 3,

KEPLER_FOV Search MAST KIC Search Help

Contamination Value

The "contamination" value is a floating point number between 0 and 1 representing the fraction of light in the aperture NOT due to the target star. A value of 0 means all the light is from the target, 1 implies all background. 0.5 means half the light is due to the target. (Note for Kepler science team members, contamination = 1 - crowding value.)

Effective Temperature

Derived effective temperature. Currently values range from 3,105 to 19,336 K.

Log G

Estimated Log10 surface gravity. Currently values range from -0.43 to 6.16

Seasons Target on CCD

Choose the periods for which targets must be on the detector. The default ("**any**") implies the target(s) must be on the detector for at least one season. The other options include:

- "**all**" (target must always be on the detector)
- "**season_0**" (target is on the detector for at least season_0),
- "**season_1**" (target is on the detector for at least season_1),
- "**season_2**" (target is on the detector for at least season_2),
- "**season_3**" (target is on the detector for at least season_3),
- "**unspecified**" (target is on or near the detector), Note that of the total ~6.5 million entries, roughly 2 million are considered near, but never on, the detector. i These entries are normally excluded from the search UNLESS the user selects the "unspecified" option.

Minimum Distance from Edge

Specify the minimum distance a target may be from the edge of the detector. For example, if you only want targets at least 50 pixels from the closest edge, enter 50. Range is 1 to 511. **Note: do not use "<", ">", or other numerical operators for this form element.**

Kepler Magnitude

Kepler Magnitude. Current range: 2.98 to 24.99

KEPLER_FOV Search MAST Kepler Quick Column Help

User Specified Search Field

You may now search on any column in the mission database. Select the field you wish to search on and type in the qualification. NOTE that if you choose a field in BOTH the form and in the User Option field, then you may not get results or the result you expect.

In the table below is a list of all the column names available for search. Where reasonable a range or set of valid values is listed. Additional useful notes are included. If you click on the field name, a more detailed description of the data will be found. The column label is used in the search forms and search results. The column name needs to be specified for GET requests.

Column Name	Column Label	Data Type	Valid Values	Notes	UCDs
kic_kepler_id	Kepler_ID	long	range: 482,249 to 13,160,229	Unique Kepler ID. Also used in Kepler Target Catalog and in naming data files. Note there are 6,569,466 entries in the KIC_CT joined table	ID_MAIN
kic_tmjd	2MASS_ID	long	range: 79221107 to 1316970448	2MASS catalog ID	ID_CATALOG
kic_degree_ra	RA (J2000)	double	range: 279.14 to 302.32 degrees	Right Ascension (J2000) in decimal degrees. All but roughly 36,000 photometric standards, are within the Kepler FOV.	POS_EQ_RA_MAIN

Non-Target Data

- **Full Frame Image (FFI) – pre/post-roll image of Kepler field of view**
- **Cadence – 1min/30min sum of pixel values for all targets**

Don't expect to have much demand for these data, but still need an interface.

Design is in progress.

Times in Kepler Data Headers

Several FITS keywords in the Kepler data headers relate to time.

Rule of thumb:

- **primary header keywords are UTC (geocentric)**
- **extension keywords are TDB (barycentric)**

Light curve headers may be different.

- **The DMC is working with SOC developers on the light curve headers.**

Barycentric Dynamic Time (TDB)

By definition, TDB contains a relativistic correction.

>These corrections amount to as much as about 1.6 milliseconds and are periodic with an average of zero.

The times in the Kepler data headers do *not* contain this relativistic correction.
